

Water monitoring and reporting

(VMO RA2)

Rob Davies-Colley (PL)

Richard Storey

Graham McBride

Aslan Wright-Stow

NIWA-Hamilton

(& Deborah Ballantine – ex NIWA)

Outline of talk

1. Review VMO programme work... on (biophysical) water monitoring and reporting
2. Overview MfE's NEMaR project (VMO co-funding)
3. Outline research challenges...

AND... (to keep you awake!)

*Distill a few important principles
of water monitoring*

Why monitor (and report on) water?

'Cause you can't manage what you don't measure'

Main reasons* (State & Trend)

1. Define STATE of the environment
2. Track CHANGE in state... over time

Other reasons*

1. Global vs catchment change
2. Scientific understanding
3. Modelling
4. Policy (Is it working?)

**From Davies-Colley 2012 NEMaR report.*

Rob's water monitoring principle No1!

There is no perfect water monitoring network

OR

No (real) water monitoring network can answer all Q's that may be thrown at it

NEMaR project

*Aimed at achieving **consistent and dependable** monitoring... for national reporting...*

Workshops with expert panels...

Major findings from NEMaR*

- **Indicators** defined (Super-index?)
- **Variables** defined (= NRWQN)
- **Timing** – monthly
- **Protocols** outlined (~ NRWQN)
- **Site ‘coverage’** reviewed (reference sites)

NRWQN a ‘model’ for river monitoring

(*) Based on several major reports
to MfE (website)

Rob's water monitoring principle No2!

The best check on data quality is if an ***independent*** agency gets the same numbers as you!

SO (for good QA)

Have a small fraction (say ~ 5%) of measurements independently duplicated

VMO monitoring achievements, yrs 1-3

- **Review article on NRWQN** (Davies-Colley et al. 2011*)
- Chapter overviewing **River WQ in NZ** (Davies-Colley 2013*)
- 2 articles on **technical aspects of WQ monitoring**
 - Pollution loads in Sherry River (Ballantine & Davies-Colley 2013*)
 - Trends in NRWQN rivers (Ballantine et al. 2013 for *EMA*)
- **Statistical article** (McBride et al. 2013 in *EMA*)
- **Upgraded TimeTrend tool**

(www.niwa.co.nz/our-science/freshwater/tools/time-trends)

- **Conference presentations**
(e.g. on research needs in
water monitoring, NZFSS 2012)

In progress -

BBN - community collab. pilot

() Publications available –
at this forum or on e-request
(r.davies-colley@niwa.co.nz)*

Some principles of good long-term water monitoring

- Clear objectives
- Careful design
- Parsimony
- Address 'values'
- Report data summaries
- QA – ensure accuracy
- Consistent operation
- Integration (hydro/WQ/bio)

Principles are as given in Davies-Colley et al. (2011) review of the NRWQN;

Similar to those of Lindenmeyer & Likens (2010) “Effective Ecological monitoring” CSIRO.

Water monitoring research needs in NZ

- **Turning data into information...**

Statistical tools for reporting

(Future VMO work)

- Handling “<DL”
- Efficient ID of drivers of change

- **QA in water monitoring***

() major area of ‘unfinished business’ from NEMaR*

- A National QA programme (‘auditing’ visits)
- Pollutant loads; continuous WQ recording

- **Community monitoring**

- ‘Concordance’ of community and RC data
- Resources for RCs to foster community (esp. iwi) involvement
- SHMAK upgrades and extension
