The screenshot shows the LRIS portal interface. At the top left is the LRIS logo. To its right is a search bar with the text "Search for data & maps" and a "Search" button. Further right are links for "Help" and "Sign in". Below the logo is a navigation menu with "Home" and "Browse Data". The main content area features a "Featured" section with a map of New Zealand and text describing the "LCDB v4.1 - Land Cover Database version 4.1". Below this is a "Most Popular" section with three data collection cards: "NZLRI Land Use Capability", "FSL New Zealand Soil Classification", and "NZDEM North Island 25 metre". Each card includes a map thumbnail, a title, and a "New" date. At the bottom is a "Latest" section.

Crane<sup>1</sup> & M. A. Bradford<sup>1</sup>

The global extent and distribution of forest trees is central to our understanding of the terrestrial biosphere. We provide the first spatially continuous map of forest tree density at a global scale. This map reveals that the global number of trees is approximately 3.04 trillion, an order of magnitude higher than the previous estimate. Of these trees, approximately 1.30 trillion exist in tropical and subtropical forests, with 0.74 trillion in boreal regions and 0.66 trillion in temperate regions. Biome-level trends in tree density demonstrate the importance of climate and topography in controlling local tree densities at finer scales, as well as the overwhelming effect of humans across most of the world. Based on our projected tree densities, we estimate that over 15 billion trees are cut down each year, and the global number of trees has fallen by approximately 46% since the start of human civilization.

Forest ecosystems harbour a large proportion of global biodiversity. The current estimate of global tree number is approximately

# Use of NZ standard for taxonomic names allows integration with trait data

The screenshot shows a Microsoft Internet Explorer browser window with the address bar displaying <http://ecotraits.landcareresearch.co.nz/>. The browser's menu bar includes File, Edit, View, Favorites, Tools, and Help. The address bar also shows a search icon, a home icon, and a search field. The website's header features a green background with a leaf logo on the left and the text "Ecological Traits of New Zealand Flora" and "Manaaki Whenua - Landcare Research DATABASES". Below the header is a navigation menu with buttons for "ALL DATABASES", "PLANTS PORTAL", "ECO TRAITS HOME", "SEARCH", "ABOUT", "FEEDBACK", and "HELP".

## Ecological Traits of New Zealand Flora

Click [here](#) to start exploring the traits database...

This database of ecological traits, linked to Landcare Research's suite of databases related to plant systematics, is designed as a one-stop-shop for questions such as 'what kind of plant is this?', 'is it a weed?', 'does it produce viable seeds?', 'how is the seed dispersed?'.

See [About](#) the ecological traits database for more details including the [publication](#) list.

### Trait categories covered by this database

 Status in NZ	 Distribution	 Morphology	 Reproduction	 Flower and Fruit	 Other/Wetland
---	---	---	---	---	--

### Download trait data

A web service is also available for downloading plant trait data. For more information email [Kevin Richards](mailto:Kevin.Richards@landcareresearch.co.nz) at Landcare Research. The sample application for the web service can be downloaded from [here](#).

I am reconstructing palaeoclimates from ~4 million years ago from fossil pollen assemblages from the Australian Nullarbor. These assemblages include Geniostoma (Loganiaceae), which is rare in Australian rainforests, but widely distributed in NZ. We are basing our palaeoclimate reconstructions on presence/absence data, (that is, quadrat or other survey data), rather than on presence-only data. Unfortunately, our compilation of Australian quadrat data includes only two records of Geniostoma. To generate a meaningful climate estimate from Geniostoma which is comparable to those for our other taxa, we are interested in acquiring quadrat/survey data from NZ, in order to estimate the distribution of the genus within temperature- and precipitation-space. Hence we need a large quantity of quadrat data: both with and without Geniostoma, in order to define this distribution using generalised additive models.

Wiser<sup>37</sup> & M. A. Zavala<sup>38</sup>

Forests are major components of the global carbon cycle, providing substantial feedback to atmospheric greenhouse gas concentrations. Our ability to understand and predict changes in the forest carbon cycle—particularly net primary productivity and carbon storage—increasingly relies on models that represent biological processes across several scales of biological organization, from tree leaves to forest stands<sup>1–3</sup>. Yet, despite advances in our understanding of productivity at the scales of leaves and stands, no consensus exists about the nature of productivity at the scale of the individual tree<sup>4</sup>, in unit leaf area (or unit leaf mass)<sup>5,6</sup>, with the implicit assumption that declines at these scales must also apply at the scale of the individual tree. Declining tree growth is also sometimes inferred from life-history theory to be a necessary corollary of increasing resource allocation to reproduction<sup>7–10</sup>. On the other hand, metabolic scaling theory predicts that mass growth rate should increase continuously with tree size, and this prediction has also received empirical support from a few site-specific studies<sup>11–13</sup>. Thus, we are confronted with two conflicting generalizations about the fundamental nature of tree growth, but lack a global assess-

# Meeting 'Open Data' requirements: NVS solution

The screenshot shows the Landcare Research Datastore website. At the top, there is a navigation bar with the 'DATASTORE' logo, 'Landcare Research Manaaki Whenua' branding, and links for 'Datasets', 'Organizations', 'Groups', and 'About'. A search bar is located on the right side of the header.

The main content area is divided into several sections:

- Search Your Data:** A search box containing the text 'eg. Gold Prices'. Below it are 'Popular Tags' including 'New Zealand', 'Taxonomy', and 'Systematics'.
- Landcare Research Datastore statistics:** A summary of site metrics: 10 datasets, 4 organizations, 2 groups, and 2 related items.
- Welcome banner:** A large image with the text 'Welcome to the Datastore - the Landcare Research Data Repository' and 'By using this site you agree to the Terms and Conditions'.
- Landcare Research:** A section with the Landcare Research logo and the text 'Top level organisation for depositing datasets...'. It includes a 'Rabbit Information Database' (described as a searchable database of published and unpublished articles) and 'Phylogenetic Trees - Clitopilus Etc' (described as data for Maximum Likelihood phylogenetic trees).
- Biodiversity Data:** A section with a folder icon and the text 'Biodiversity Data' and 'Biodiversity related datasets'. It also includes 'Phylogenetic Trees - Clitopilus Etc' with a 'next' button.

The footer contains links for 'About Landcare Research Datastore', 'CKAN API Open Knowledge Foundation', and 'OPEN DATA'. It also features a 'Powered by ckan' logo and a language dropdown menu set to 'English'.

# Soil fertility induces coordinated responses of multiple independent functional traits

Melissa M. Jager<sup>1</sup>, Sarah J. Richardson<sup>2</sup>, Peter J. Bellingham<sup>2</sup>, Michael J. Clearwater<sup>1</sup> and Daniel C. Laughlin<sup>1\*</sup>

<sup>1</sup>Environmental Research Institute School of Science University of Waikato, Private Bag 3105, Hamilton 3240, New Zealand; and <sup>2</sup>Landcare Research, PO Box 69040, Lincoln 7640, New Zealand

## Summary

1. A central goal of functional ecology is to determine how independent functional traits are filtered by environmental conditions to improve our understanding of the community assembly. Soil fertility clearly influences community composition, but it is unclear how plant functional traits are most strongly associated with gradients of increasing nutrient availability.
2. We hypothesized that leaf economic traits and stem tissue density would be strongly associated with soil fertility given their direct relationship to soil resource acquisition and use. We also hypothesized that functional traits that are commonly associated with competition (e.g. maximum height), shade tolerance (seed mass) and resistance to disturbance (bark thickness) would be unrelated to soil fertility.
3. We measured 13 functional traits from 30 tree species occurring in 40 plots across a nutrient gradient in a mature warm temperate rain forest in Northland, New Zealand. Principal component analysis revealed that leaf economic traits and stem tissue density were strongly associated with soil fertility, while maximum height, shade tolerance and resistance to disturbance were unrelated to soil fertility.

## Acknowledgements

This research was supported by a grant (UOW1201) from the Royal Society of New Zealand Marsden Fund, a University of Waikato Research Scholarship, and Core funding for Crown Research Institutes from New Zealand's Ministry of Business, Innovation and Employment's Science and Innovation Group. We thank the Piki te Aroha Marae Trust and the Pukekū Forest Trust, Adrian Walker and the NZ Department of Conservation, Mike and Annette Richardson, Cate McInnis-Ng, Kris Kramer-Walter, Rowan Buxton, Chris Morse and Antonia Vincent for their help and support.

## Data accessibility

All data used in this study, including plot-level species basal area, plot-level environmental variables and species' functional traits, are available online at Landcare Research Datastore (<http://dx.doi.org/10.7931/V11593>).

# Puketi Forest 2011 Trait variation along a toposequence

Trait variation along a toposequence - we sampled forest composition along a toposequence in permanent plots and matched composition to trait values and soil chemistry.

The data support an article in *Journal of Ecology*: Jager MM, Clearwater MJ, Richardson SJ, Bellingham PJ, Laughlin DG. 2014. Soil fertility induces coordinated responses of multiple independent functional traits. *Journal of Ecology* (doi:10.1111/1365-2745.12366).

*These resources (data files) represent snapshots of data extracted from the National Vegetation Databank (NVS) for analysis supporting this manuscript. NVS is a living database, and data are subject to error correction and other amendments over time. The most current version of these data can be requested via the NVS website by searching for the datasets "Puketi 2011" and "Puketi Traitspace 2012".*

### Data and Resources

- 
**Metadata: Puketi trait variation along ...**  
 Field descriptions/definitions for the 3 CSV data files: plot... [Explore](#)
- 
**Plot environment coordinates CSV**  
 Plot-level locations and soil chemistry measures. Clicking on the map... [Explore](#)
- 
**Species traits CSV**  
 Species mean trait values sampled across the plots. [Explore](#)
- 
**Species basal area CSV**  
 Sum basal area for each species in each plot. [Explore](#)
